Some of the code. Some of the code is available via [pending](#). The R, Python, and JavaScript code are currently hosted on GitHub. The R code for these cases is available [here](#). Python data files are not currently available. Python code is available [here](#). JavaScript code is not currently available. E-mail from John if you need the data. You can apply for access to the data [here](#). Request for "Machine Learnings of Germany's Political Parties: Datasets & Code". On Twitter: [of free radical scavengers in aging and heat treatment](#). The measurement of free radical scavengers, glutathione and vitamin E in rat organs was studied to see if they are modified by heating and aging. The contents of both free radical scavengers decreased in rat organs with increasing age, and vitamin E level decreased more drastically than that of glutathione. After heating, glutathione level decreased more in liver than in kidney, and in brain, vitamin E content decreased in the brain in higher temperature than that in the liver and kidney. The amounts of glutathione and vitamin E in the liver of rat treated with 4 degrees C water solution for 3 days were significantly higher than those treated with 25 degrees C water solution. These results suggest that glutathione and vitamin E are maintained in rat body by a different pathway from that of lipid in cell membranes and by heat stress. Direct laser writing in digital photopolymers using a single beam. A single beam system capable of direct writing of different types of polymer and glass in 1 min or less is described. For this purpose, a variety of resin systems was investigated using the methods of polymerase chain reaction and DNA sequencing. For writing of polymers, it was observed that a combination of UV excimer laser ($\lambda(\text{ex}) = 248 \text{ nm}$, $\lambda(\text{em}) = 308 \text{ nm}$) with a thulium laser ($\lambda(\text{ex}) = 267 \text{ nm}$, $\lambda(\text{em}) = 526 \text{ nm}$) can write polymers containing the DNA amplified fragment of interest. Polymerase chain reaction (PCR) fragments of 40-70 nucleotides in length were produced within 0.6-0.8 s. All polymers were written in less than 1 min. The use of thulium 82157476af
